Measuring Guide for Bali® Cellular Shades

Choose a Mount Type: **Inside Mount or Outside Mount**
(See next page if you need help deciding which mount is best for your windows.)

**Inside Mount**  Window treatments are installed inside the window casing.

- **Measure Depth:** See chart on next page to determine if window casing has enough depth for an inside-mount window treatment.
- **Measure Width:** Measure the inside width of window casing in three places. Record narrowest measurement.
- **Measure Height:** Measure the inside height from the top of window casing to top of sill in three places. Record longest measurement.

**Note:** To make sure your shade fits as well as possible, choose a whole inch width that is at least 3⁄8" smaller than your window. You may need to round down to get the correct width. The manufacturer will make NO deductions.

**Outside Mount**  Window treatments are installed outside the window casing. Mount directly to wall or molding.

- **Measure Width:** Measure width to be covered. We recommend 1½" overlap on each side of the window (3" total) for optimum light control and privacy. Record measurement.
- **Determine Headrail Location:** Determine if headrail will be on molding or above molding and mark spot.
- **Measure Height:** Measure height to be covered from top of headrail location to top of sill or lower if overlap is desired for additional light control and privacy. Record measurement.

**Note:** The manufacturer will make NO deductions.
Mounting Considerations

Reason for Choosing Inside Mount

Clean Look
• Inside-mount treatments are installed inside the window casing, showcasing attractive window trim.
• The window opening frames the window treatment for a finished, clean appearance.

Allows Sill Space on Deep Windows
• In some deep-set windows, the window treatment can be installed to allow plants or other items to be placed in front of the window treatment on the sill.

Limitations of Inside Mount

Light Gaps
• Because the shade must be slightly smaller than your window to ensure the best possible fit and performance, a small gap on each side of the treatment will affect its ability to fully darken a room.

Obstructed View
• The stack (compressed portion of the window treatment when fully raised) will obstruct part of the view from the window.

Architectural Obstacles
• Obstacles such as handles and cranks can interfere with the operation of inside-mount treatments.

Reason for Choosing Outside Mount

Improve Privacy and Light Control
• Light gaps on the side of the window treatment can be substantially diminished or eliminated.

Fewer Installation Limitations
• Outside-mount window treatments are ideal for covering non-square windows.
• Outside-mount window treatments are installed higher than the window opening for an unobstructed view when fully raised.

Architectural Obstacles
• Outside-mount window treatments can clear obstacles like handles and cranks.

Enlarge the Look of a Small Window
• Increase overlap above and below or to each side of the window.

Hide Window Trim
• Outside-mount window treatments can easily hide unattractive window trim.

Limitations of Outside Mount

Required Surface Above Window Frame
• Outside-mount brackets require at least 2" of flat surface above window or on window frame for mounting brackets.

Inside Mount Window Casing Minimum Depth Requirements

<table>
<thead>
<tr>
<th>Shade Type</th>
<th>Control Type</th>
<th>A. Minimum depth needed for Flush Mount</th>
<th>B. Minimum depth needed for Partially Recessed</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/8” Cellular Shades</td>
<td>Cordless Lift</td>
<td>2⅛”</td>
<td>½”</td>
</tr>
</tbody>
</table>

A. Flush Mount: The window casing is deep enough to mount the entire headrail inside it.
B. Partially Recessed: The depth of the window casing is less than the space necessary for a flush mount. Part of the headrail will protrude from the window casing when it is installed.
